# Model challenges

**Complexity** – understanding

**Processes** – calibration, error

**Dynamics** – non-steady state, feedbacks

**Scaling** – using earth observation effectively

# Models, Data and Occam's razor

**Complexity** –simplification of models to represent key factors and interactions

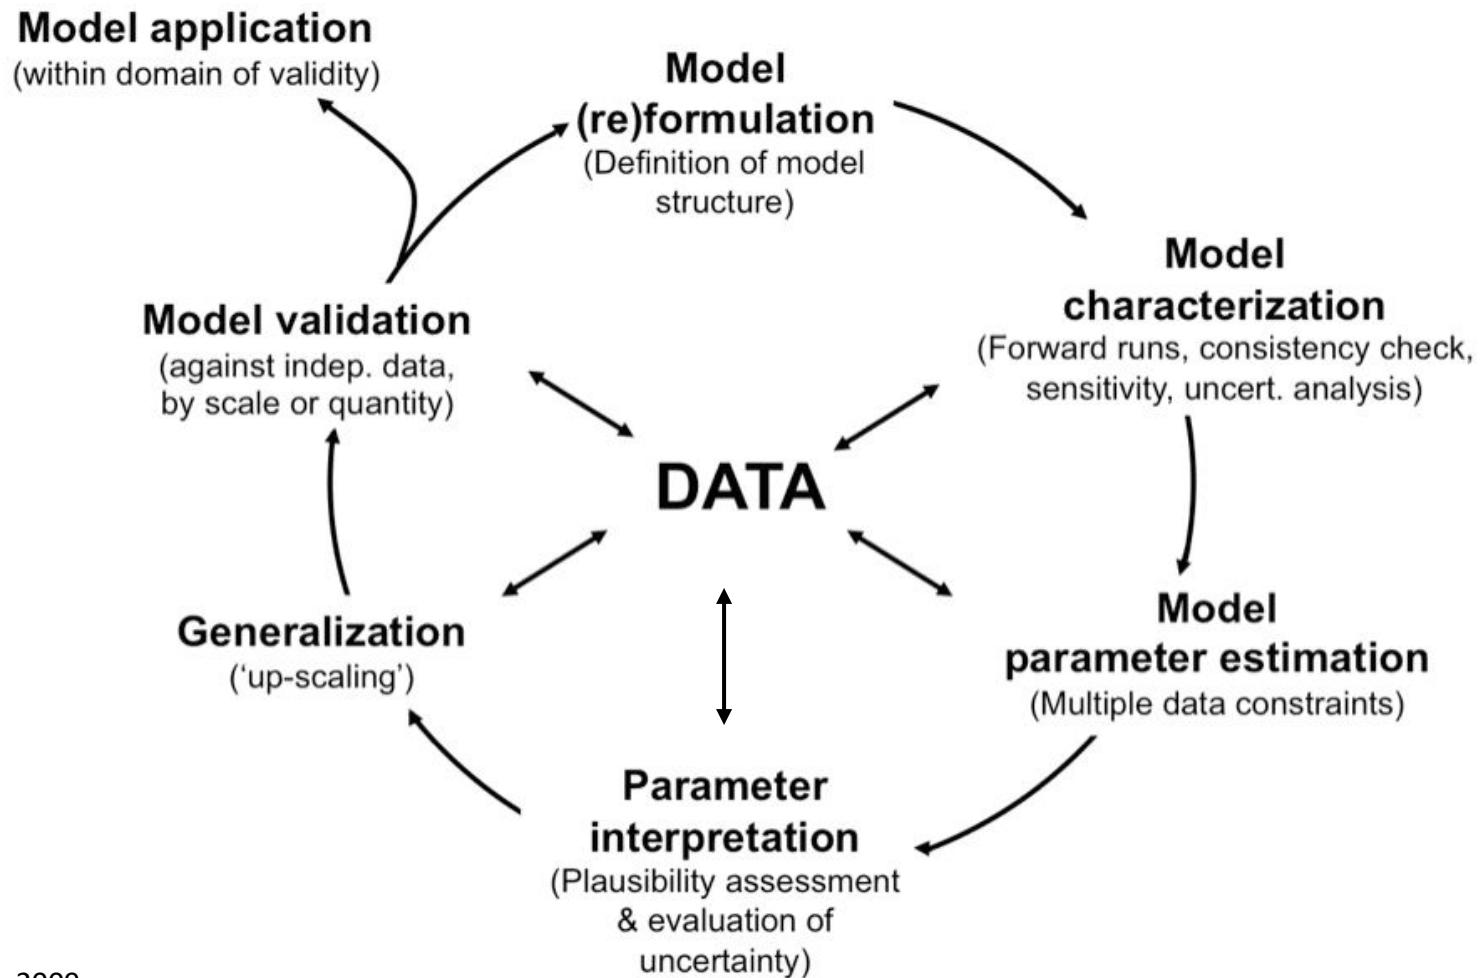

**Processes** – use data to constrain parameters and study the emergent patterns

**Dynamics** – use time series data to constrain time constants for transient systems, with explicit uncertainty

**Scaling** – use multiple orthogonal spatial data to extend knowledge

# Combining data with (simple) models

Williams et al. 2009

# Emulating a complex canopy model

- Multiple canopy layers
- Radiative transfer scheme
- Leaf level energy balance
- Light and dark reactions
- Stomatal model
- Plant water transport
- 30 min time step, 100+ parameters,

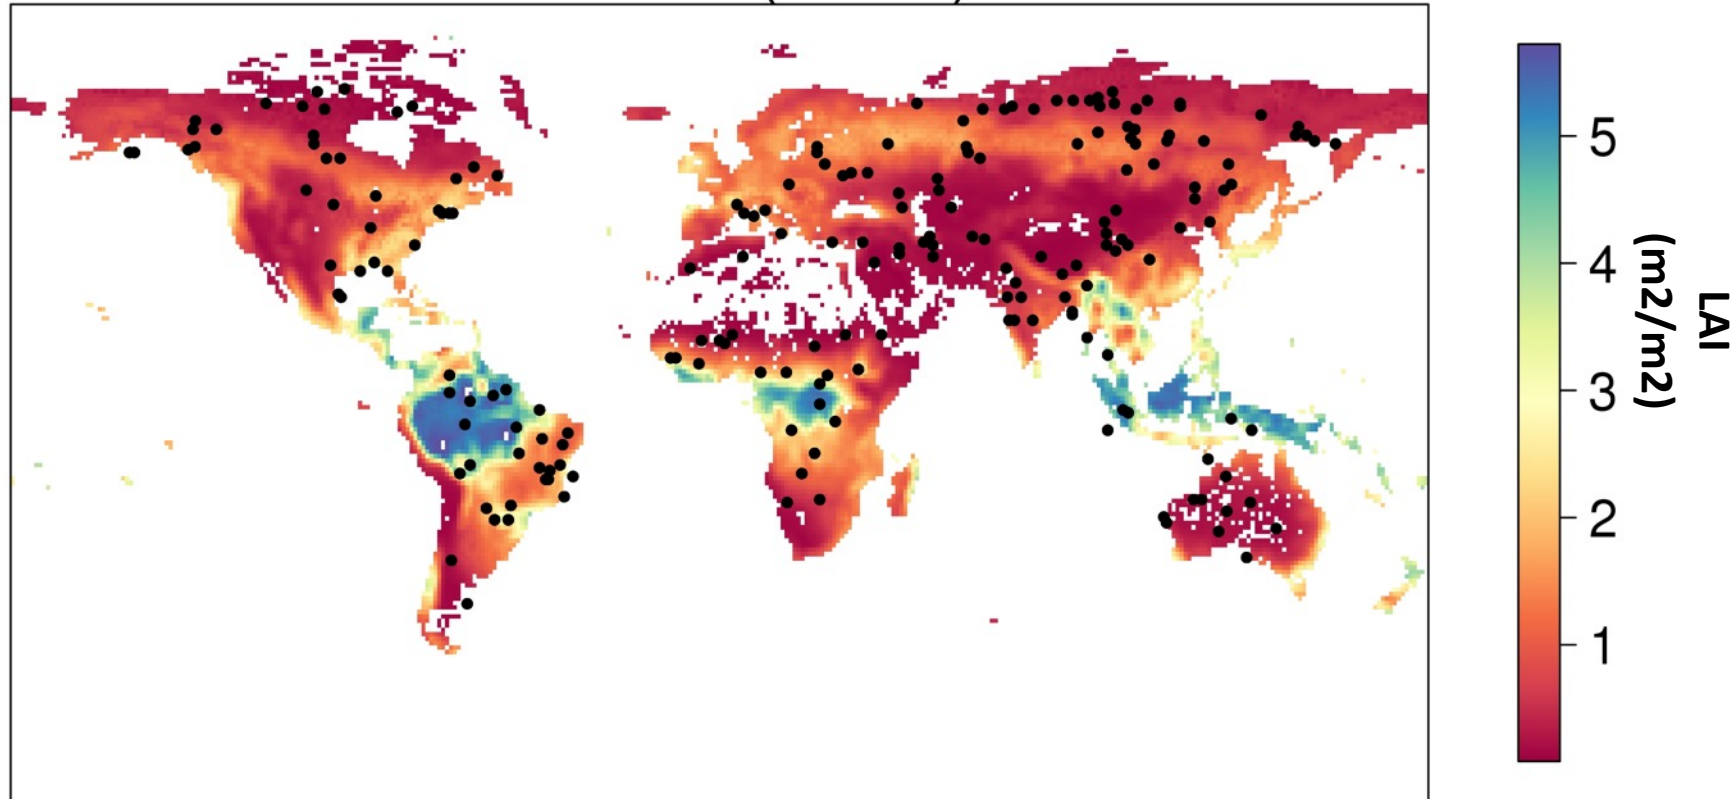

# Use process knowledge to guide emulation

- $p_N = a_1 NL \exp(a_2 T)$
- $p_C = p_N (C_i - \theta) / k + (C_i - \theta)$
- $p_D = g_c (C_a - C_i)$
- $g_c = f(\text{soil moisture}, T, \text{VPD})$
- $p_C = p_D$
- $p_I = E_0 / p_D / (E_0 / p_D + p_D)$
- 10 parameters
- 7 daily drivers

# Location of calibration sites selected using stratified random sampling

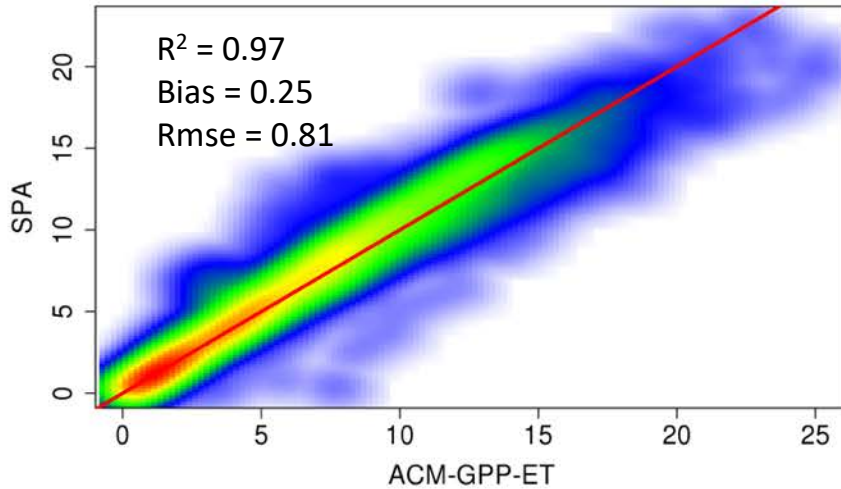

Variation in LAI, day length, temperature, radiation, VPD, CO<sub>2</sub>, foliar N, soil moisture

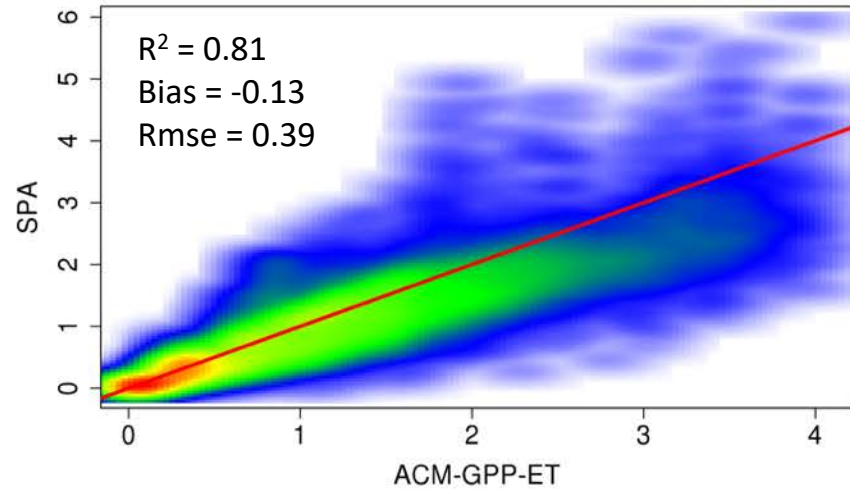

# Fit simple model to complex LSM

GPP

Transpiration

Soil evaporation

Smallman et al (in prep)

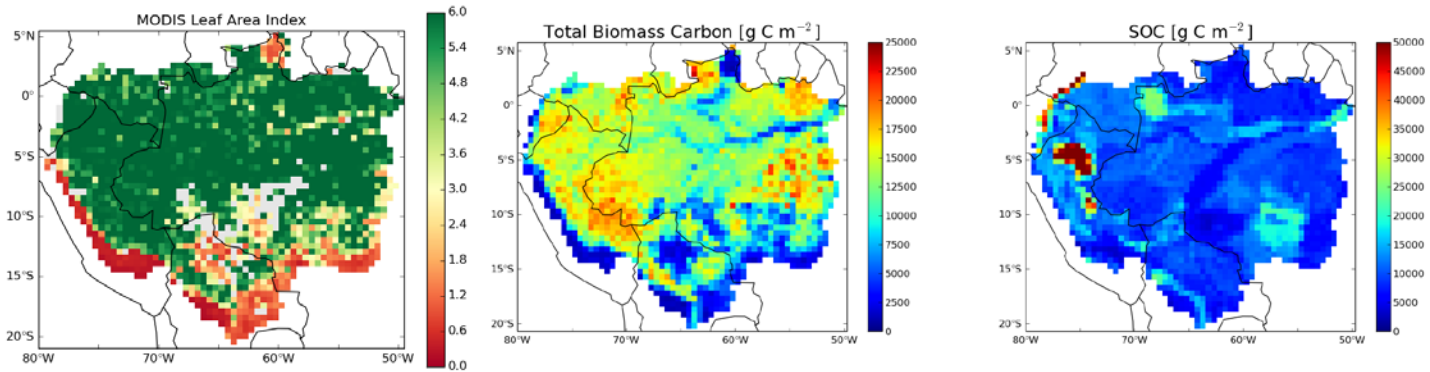

# DALEC

# Carbon-Data-Model Framework: CARDAMOM

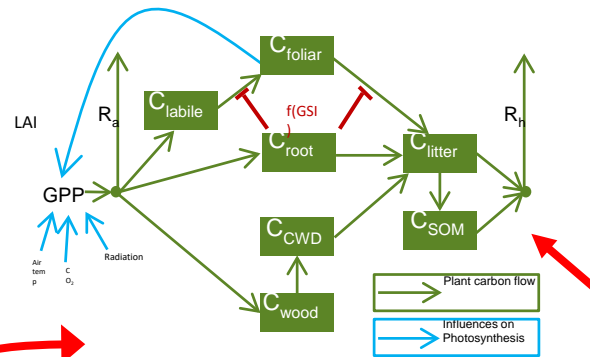

- DA in each pixel
- No PFTs
- Continuous maps of parameters

## Observations – LAI time series, biomass, SOC

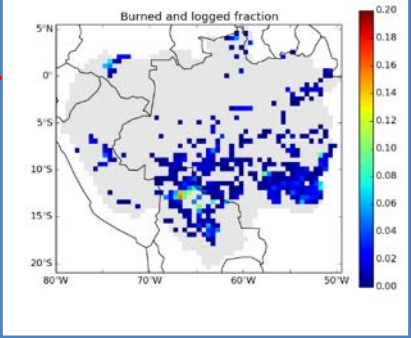

## OUTPUT

PDFs of parameters, fluxes, pools, etc...

## DRIVERS

CRU+NCEP weather  
GFED burned area

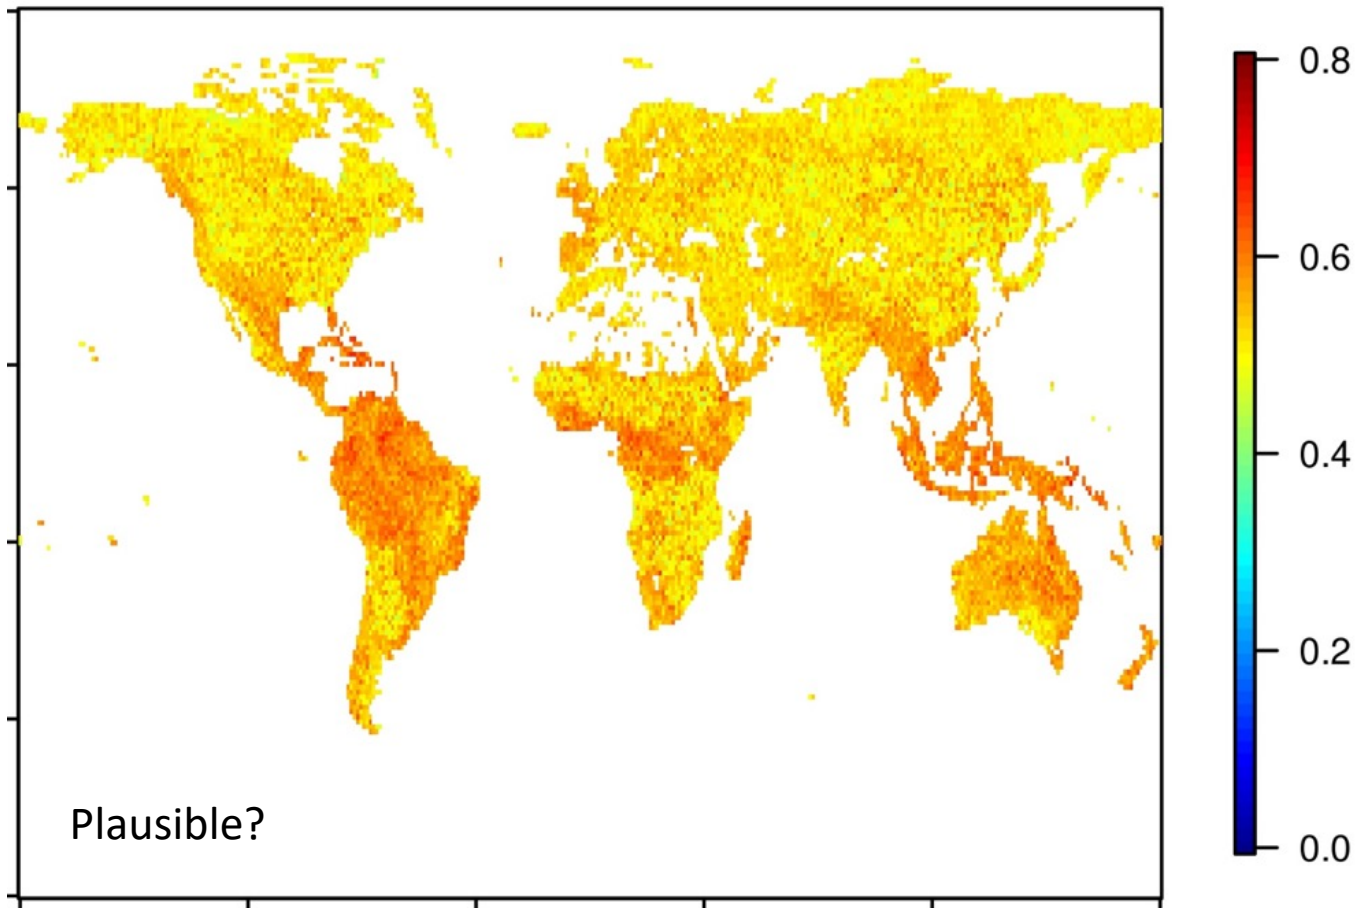

MDF algorithm

Update

# Maps respiration variability

Ra:GPP

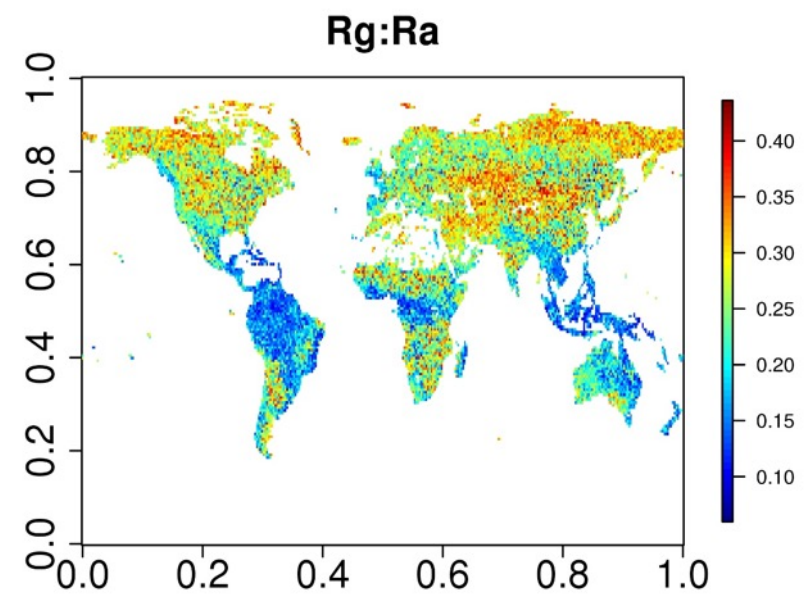

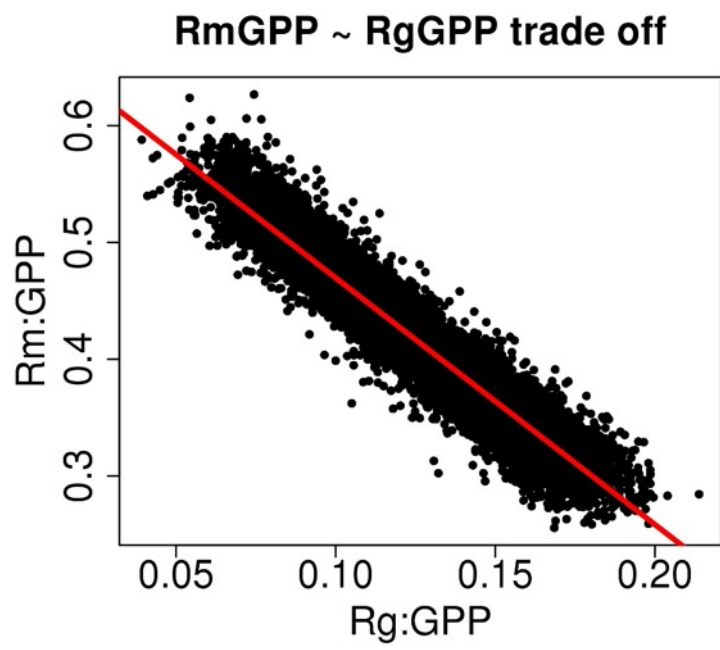

Plausible?

# Identifies components of respiration

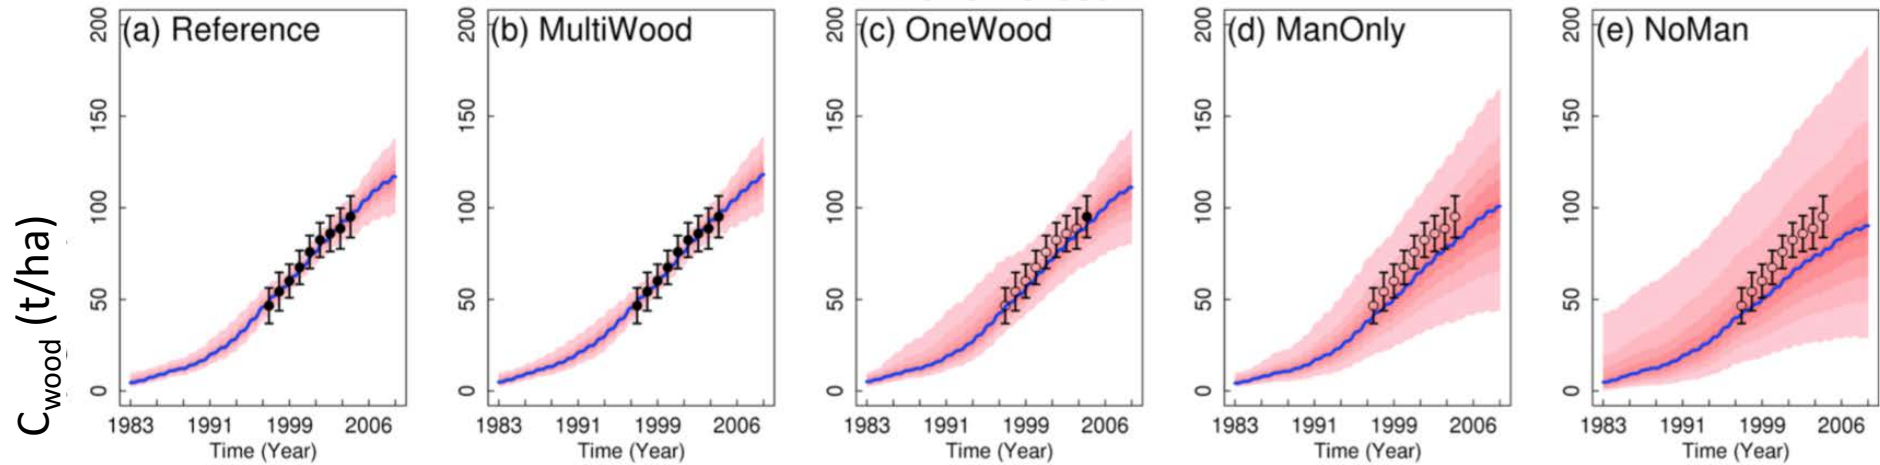

Smallman et al (in prep)

# Constraining dynamics

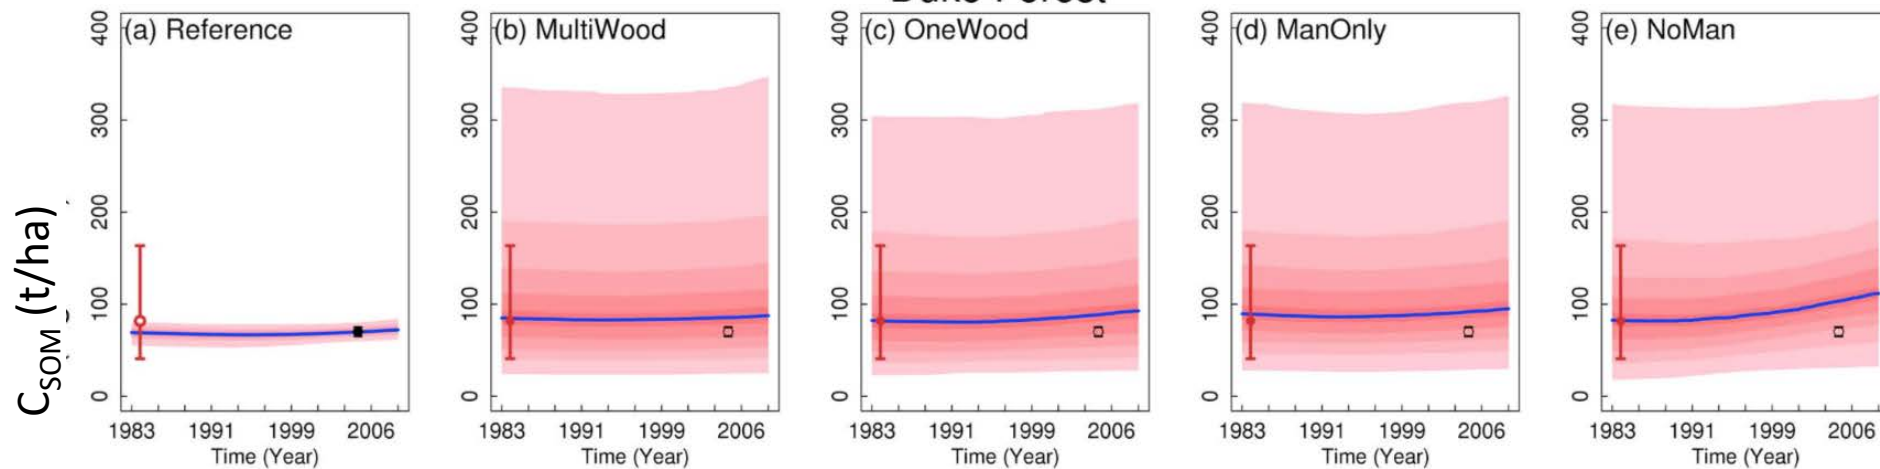

- Aggrading forest, non steady-state
- Duke Forest, NC (Loblolly Pine planted in 1983)
- What information is required to constrain model parameters?

### Duke Forest

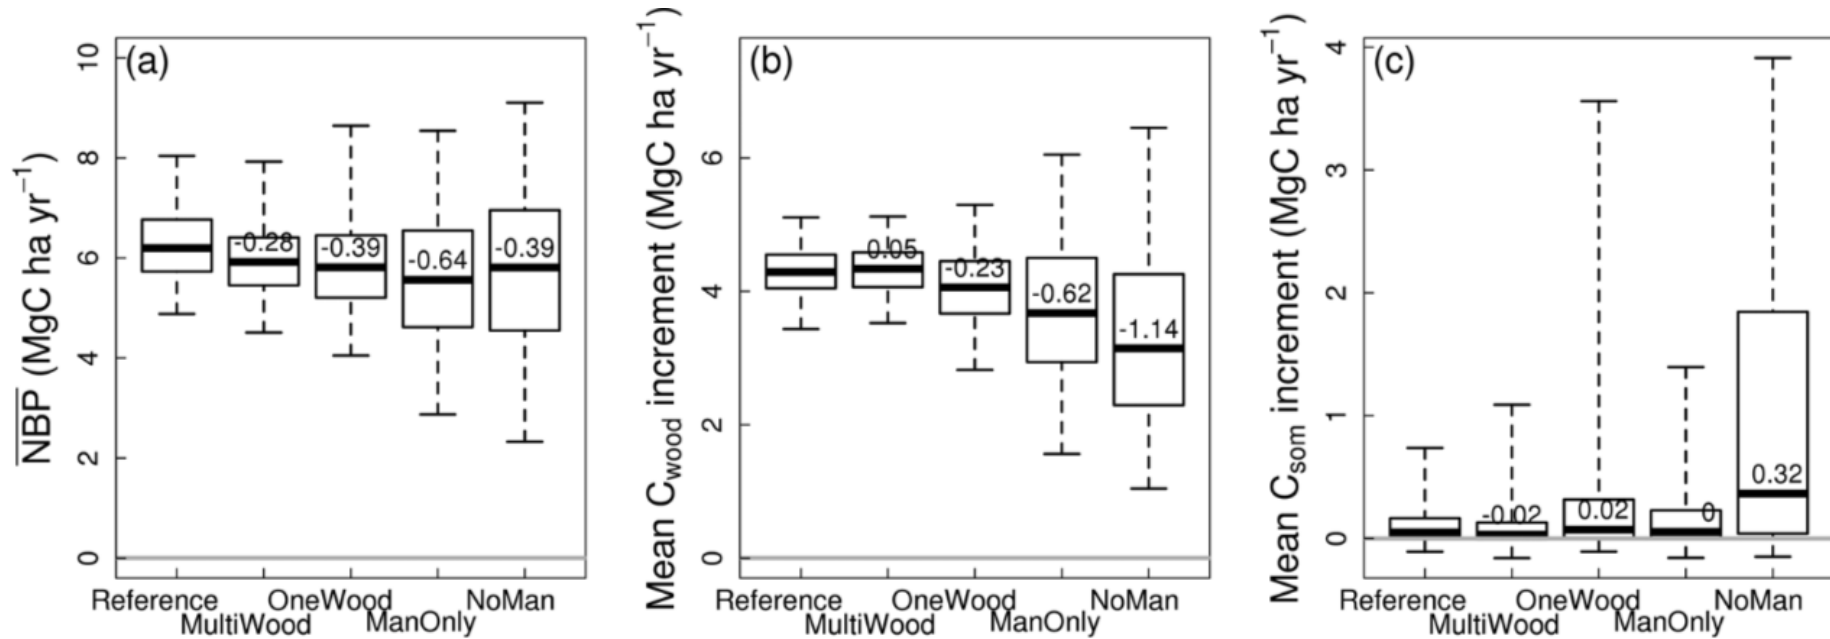

### Duke Forest

School of GeoSciences

# Conclusions

- Simplify models to allow fast running, and focus on emulating key processes
- Use multiple time series data to constrain dynamics (LAI, biomass) and propagate information into SOM
- Incorporate uncertainty into calibration process, and into predictions
- Use data from recent historical period to evaluate models in space and time

# Thanks

No uncertainty estimate

## CARDAMOM

GPP (2010-2015) = 125 (85/181) PgC yr<sup>-1</sup>

# Uncertainty in GPP analysis

Absolute 95% CI Range

Relative 95% CI Range

# Managing complexity

- Tendency to add parameters to model
- Increased demand for high resolution forcing
- Computational load
- Harder to understand sensitivity
- Difficult to determine uncertainty
